                                                                                   Matches
                                                                                                                                                                                                                              high molecular weight kiningen. High molecular weight kiningen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kiningen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kiningen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     (UTEM )

                                                                                                                                                                                                                                                                                                            high molecular weight kininogen. High molecular weight kininogen is a 120 kbg glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

                                                                                                                                                                                                              The present sequence represents the light chain of human high molecul weight kininogen. High molecular weight kininogen is a 120 kpa glycoprotein which binds with high affinity to endotheilal cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                                                                                                    Sequence

It is used to produce compounds of the invention. High molecular weight kiningen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kiningen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kiningen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting endothelial cells with a compound containing high molecular weight kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.
                                                                                                  A wound treating agent contg. a partial peptide of kininogen have growth promotion activity of fibroblasts.

human kininogen f agent compsns. ar useful in wound t

fragment

 amino acids is a partial

peptide corresponding

ino acids 458-520. Partial peptides of bovine and in fragments 1.2, 1 and 2, are used in wound treating and act as the active component. The fragments are

nent. The fragments are growth promotion activity

because

                                                                                   The present sequence represents an analogue of the light chain of human high molecular weight kininogen. High molecular weight kininogen is a 120 kDa glycoprotein which binds with high affinity to endothelial cells, where it is cleaved by plasma kallikrein into heavy and light chains. Analogues of high molecular weight kininogen are used in the method of the invention. The specification describes a method of inhibiting endothelial cell proliferation. The method comprises contacting kininogen analogues. The method and the compounds can be used for inhibiting endothelial cell proliferation. The compounds can also be used for inhibiting angiogenesis. The compounds can also be used to inhibit migration of endothelial cells to vitronectin.

Partial peptides of bovine and human kininogen fragments 1.2, 1 and 2, are used in wound treating agent compens. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity

                                      The patent discloses a method for preventing or treating a disorder resulting from the release of bradykinin in a mammal which produces a heparin-binding protein (HBP) that binds to a HBP antagonist. This method involves administration of a mammalian HBP antagonist (especially aprotinin) and/or monoclonal antibodies that bind to prekallikrein-H-kininogen complexes in the HBP, to decrease the release of bradykinin in the mammal. The antagonists of HBP (e.g. aprotinin) decrease the permeability of the endothelial cells and are used to prevent or treat disorders resulting from the release of bradykinin such as systemic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        AAR75178 is a partial peptide corresponding to bovine kininogen fragment 1.2, amino acids 387-496. Partial peptides of bovine and human kininogen fragments 1.2, I and 2, are used in wound treating agent compsns. and act as the active component. The fragments are useful in wound treating because they have growth promotion activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      immunosuppressive; vasotropic; prevention; treatment; bradykinin; aprotinin; H-kininogen; HK; systemic inflammatory response syndrome; apro-kallikrein; ischaemia reperfusion; anaphylaxis; allograft rejection;
